- Summary

Introduction: RD (pretheoretical umbrella term)

Right dislocation (RD) is a crosslinguistically common pattern in the colloquial register.

(1) a. He_i's really smart, John_i (is).

(English, Kayne 1994)

b. Il_i a mangé la soupe, Jean_i. he has eaten the soup Jean

(French, Lambrecht 1981)

c. Lo_i porto domani, $[il dolce]_i$. it bring.1sG tomorrow the dessert 'I'll bring it tomorrow, the dessert.'

(Italian, Benincà 1988)

A subtype of RD that has received little attention—that involving multiple RD-ed units (MRD).

- (2) a. He_i gave them_j to his sister, $Peter_i$, [the keys]_j. (English, Averintseva-Klisch 2009)
 - b. $Il_i \ la_j \ lui_k \ a \ donn\'ee, \`a \ Jean_k, \ [son \ p\`ere]_i, \ [sa \ moto]_j.$ he it to.him has given to Jean his dad his motorbike 'He gave it to him, to Jean, his dad, his motorbike.' (French, Calve 1985)

In familiar European languages, MRD is a straightforward extension of SRD (single RD).

An even more special and less discussed pattern: **multi-categorial multiple RD (MMRD)**. It occurs naturally in some Chinese dialects, especially in casual and relaxed speech.

(3) [Ni shangyihuir mai-di ne]_i gao-de np **lie**, [I you last.time buy-REL NMLZ put-at where SFP wo wen, ne nai_i.

[Dongying Mandarin]

I ask the milk

'Where you put that which you bought last time, I asked, the milk.' \approx 'I was asking where you had put the milk you bought last time.' (in answer to the question 'What did you ask just now?')

P Dongying Mandarin: a subvariety of Northern Mandarin Chinese

More examples of MMRD:

- (4) a. Chao caihuar chi ae, wo ji ni, jin shangwu. stir-fry cauliflower eat SFP I for you this noon 'Stir-fry cauliflower, I for you, this noon.' ≈ 'I will stir-fry cauliflower for you for lunch today.'
 - b. Zaezae-zhou ae, dei, mae yunqi lai, haoshi-zhou.
 save-DUR SFP must DISP luck LAI carefully-DUR
 'Save up, must, (good) luck, carefully.'
 ≈ 'We must carefully save up our good luck.'

[Dongying Mandarin]

Still more examples... this type of sentence is pretty common!

- (5) a. Gae-bu-liao liae, shb ye, zhe yi mer. [Dongying Mandarin] do-not-RES SFP anything also this one period 'Can no longer do, anything, this period of time.' ≈ 'One can't do anything anymore these days (due to COVID-19).'
 - b. Bu niaehur ae, zhe sie diaefen, yi daer ye.
 not sticky SFP this CL.PL starch one bit also
 'Not sticky, this starch, even a bit.'
 ≈ 'This bag of starch isn't sticky at all (i.e., is of poor quality).'
 - c. Mu jiae-hang ni man, bu shi, shang yi huir she, yinwei? not.have see-RES you SFP not COP last one time at because 'Did not get to see you, isn't it, last time, because!' \approx 'Isn't it because (I) didn't get to see you last time! (So here I am again.)'

Basic characteristics:

- RD-ed units highly versatile in syntactic category/constituency
- mostly no coreferential term (aka correlate) in main clause
- typically very incomplete main clause

Intuitively, MMRD happens when speakers are not bothering organizing language but just outputting whatever comes to mind first. It is a kind of "disorganized" speech systematically allowed by Chinese syntax—a **minor sentence type** in a broad sense.

Two additional characteristics:

- Free ordering of RD-ed units
- Not limited by illocutionary force (i.e., sentence type in the narrow sense)

More about data: free word order

MMRD shows free word order.

- (6) a. Zaezae-zhou ae, dei, mae yunqi lai, haoshi-zhou. save-dur sfp must disp luck lai carefully-dur 'Save up, must, (good) luck, carefully.'(= 4b)
 - b. Zaezae-zhou ae, dei, haoshi-zhou, mae yunqi lai. save-DUR SFP must carefully-DUR DISP luck LAI 'Save up, must, carefully, (good) luck.'
 - c. Zaezae-zhou ae, mae yunqi lai, dei, haoshi-zhou. save-DUR SFP DISP luck LAI must carefully-DUR 'Save up, (good) luck, must, carefully.'
 - d. ... All permutations work—depends on which comes to mind first!

[Dongying Mandarin]

More about data: not limited by illocutionary force

MMRD is not tied to any particular illocutionary force.

(7) [Shangyihuir mai-di ne] $_i$ gao-de np lie, last.time buy-REL NMLZ put-at where SFP

ni, ne nai_i? you the milk

'Where (you_j) put that which (you) bought last time, you_j , the milk?'

pprox 'Where did you put the milk you bought last time?' $\stackrel{\circ}{\mathcal{Y}}$

(interrogative)

More about data: not limited by illocutionary force

More examples:

- (8) a. Chao caihuar chi **bae**, ngen ji ngae, jin shangwu! (imperative) stir-fry cauliflower eat SFP you for me this noon 'Stir-fry cauliflower, you for me, this noon!'
 - pprox 'Stir-fry cauliflower for me for lunch today, please!' igotimes
 - b. Zaezae-zhou ninhae, renge dai, mae yunqi lai, yizuer! (exclamatory) save-DUR SFP others will DISP luck LAI altogether 'Save up. she/he will, (good) luck, altogether!'
 - pprox 'She/he is going to save up all her/his good luck! (surprised and amused tone)' \Leftrightarrow

Plan

In this study, I will

- review previous approaches to RD in three frameworks (Minimalism, LFG, Dynamic Syntax)
- conclude that MMRD is a challenge for all of them
- propose a new analysis integrating useful ideas from previous studies

Overview

- Introduction
- Literature review
 - Minimalism
 - LFG
 - Dynamic Syntax
- A new analysis
- 4 Summary

Minimalism

RD usually analyzed in one of two ways:

- in a single clause, "RD-ed" unit stranded upon leftward movement of the rest of the clause the monoclausal approach
- coordination of two clauses plus ellipsis in the second clause, upon leftward movement of the "RD-ed" unit the biclausal approach

Both have been applied to Chinese (S)RD—Sun (2022) applies them to inversion-like RD and argument RD, respectively.

Minimalism: Chinese

Two types of SRD in Chinese:

a. Shang feiji le, wo kuai.

Mary buy pro SFP SFP newspaper

Argument SRD is like the common European RD pattern, modulo the null pronoun.

'Probably Mary bought (it), the newspaper.' (argument SRD)

[Standard Mandarin]

(Sun 2022)

Minimalism: Chinese

More examples of inversion-like SRD:

- (10) a. Ni na tian zenmeyang a, kan Manlian juede? [Standard Mandarin] you that day how SFP watch Man.United feel 'How did you that day, feel watching Manchester United?' ≈ 'How did you feel that day watching Manchester United?' (Packard 1986)
 - b. Wo yi-miaozhong shui-zhao, deng yixia keyi.
 I one-second sleep-TEL, wait a.bit can
 'I fall asleep in one second, in a bit can.'
 ≈ 'I can fall asleep within one second in a bit.'

(overheard on TV)

Minimalism: Chinese

Sun's (2022) analysis:

- (11) a. Inversion-like SRD: focus fronting
 - $[F_{OCP}]_{vP} t_i shang feiji le]_j [F_{OC'}]_{FOC} Foc [F_{IP} wo_i [F_{I'}]_{AspP} kuai [F_{Asp'}]_{Asp} t_j]]]]]$ 'Get on the plane, I (will) soon.'
 - b. **Argument SRD: coordination-plus-ellipsis** (à la Ott & de Vries 2016) $[P_{CP_1} \ mali \ mai \ pro_i \ le \ ba \] [P_{CP_2} \ baozhi_i \ Probably Mary bought (it), the newspaper.'$

A special "colon coordinator" in (11b): Koster's (2000) specifying coordination

(11a) more flexible: does not require the RD-ed (i.e., stranded) string to be a constituent Limitation: one-round-per-clause (hence inapplicable to MRD)

Minimalism: European languages

Ott & de Vries's (2016) schema:

(12)
$$[CP_1...correlate_i...]$$
 (:) $[CP_2 dXP_i [...t_i...]]$

Two types of (S)RD:

- Colon coordination (in syntax): backgrounding (BRD)
- Direct juxtaposition (in discourse): afterthought (ARD)
- (13) Ich habe heute [einen Star] $_i$ getroffen: [den John Travolta] $_i$! [German] I have today a.acc star met the.acc John Travolta 'I met a star today: John Travolta!' (ARD) (Ott & de Vries 2016)

(The ":" here is a punctuation mark, not the colon coordinator.)

Minimalism: European languages

Ott & de Vries's (2016) derivations:

(14) a.
$$[P_{CP_1}] = [P_{CP_2}] = [P_{CP_2$$

b. $[_{CP_1}$ ich habe heute einen Star getroffen] (ARD) $[_{CP_2}$ [den John Travolta]. Acc_i [habe ich t_i getroffen]]

In general, the coordination-plus-ellipsis approach cannot handle inversion-like RD in Chinese, because Ott & de Vries's dXP is by definition a phrasal constituent.

Minimalism: MRD

As for MRD: usually mentioned in passing (and only the European pattern)

- e.g., Sun (2022): a special case of BRD, with multiple conjuncts $[CP_1: [CP_2: CP_3]]$
- CP₁ c-commands all other CPs, serving as the "antecedent" triggering repetition-based ellipsis. But this analysis is only meant for BRD (15a), not for inversion-like RD (15b).
- (15) a. 'Maria brought it_i to him_j, the dessert_i, to Gianni_j.' (A'-movement in CP_2/CP_3 + ellipsis)
 - b. 'Save up, must, DISP luck LAI, carefully.' ('must': head; 'DISP luck LAI': nonconstituent)

NB each CP in (15a) still involves discourse-driven A'-movement, which can only target constituents of certain phrasal categories!

Minimalism: An integrated solution?

Can we combine focus fronting and multi-coordination?

 $\bullet \:$ i.e., focus fronting in CP_1 & ellipsis in $\mathsf{CP}_{i \geq 2}$

In principle, yes, but resource-demanding:

• having to manipulate n + 1 CPs when there are n RD-ed units

Besides, still restricted to the familiar European pattern:

- ullet ellipsis in $CP_{i\geq 2}$ still relies on A'-movement of RD-ed units
- so only possible for certain phrasal constituents (i.e., Ott & de Vries's dXP)

A better solution: coordinating just enough structure & ellipsis without A'-movement (Such resource-awareness is seen in previous studies, though not in minimalist ones...)

LFG

Kalbertodt (2019):

- Empirical focus on German, so only about the **coreferential** pattern in European languages
- Not directly useful for MMRD, but shows us how RD can be handled by LFG

Also distinguishes BRD and ARD—e.g., same string, different intonation

```
(16) a. Ich hab ihn<sub>i</sub> gesehen, [den Peter]<sub>i</sub>. (BRD, deaccented) [German]
I have him seen the Peter
b. Ich hab ihn<sub>i</sub> gesehen. [Den Peter]<sub>i</sub>. (ARD, nuclear accent)
```

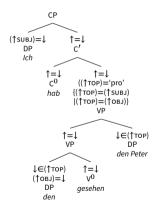

I have him seen the Peter (Kalbertodt 2019)

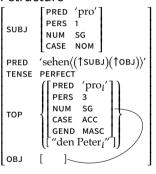

(17) Ich hab ihn_i gesehen, den Peter_i. 'I have seen him, Peter.' (BRD)

a. c-structure

b. f-structure

Kalbertodt's analysis:

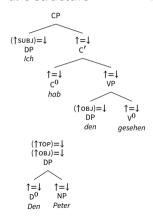

- c-structure: VP-adjunct
- part of main clause
- f-structure: topic function
- correlate den also topic

Basically a monoclausal analysis

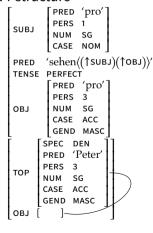

(18) Ich hab ihn; gesehen. Den Peter;. 'I have seen him. Peter.' (ARD)

a. c-structure

b. f-structure

Kalbertodt's analysis:

- separate c-structure (DP)
- called an "orphan"
- not part of main clause
- f-structure: object & topic

A biclausal analysis, but not using full CPs—though this "lite" syntax may only be apparent... (unshown elided structure)

LFG: Summary

Useful ideas:

- adjunction for structure-building
- "lite" biclausal syntax

Limitation: designed for familiar European languages

- coreferentiality-based
- only phrasal constituents as RD-ed units

Dynamic Syntax

Different from Minimalism/LFG, Dynamic Syntax (DS) directly reflects **time-linear parsing**. Thus, it has built-in **resource-awareness**, which is well reflected in its treatment of RD.

DS analysis of RD (Cann et al. 2005, Wu 2005, Chatzikyriakidis 2016):

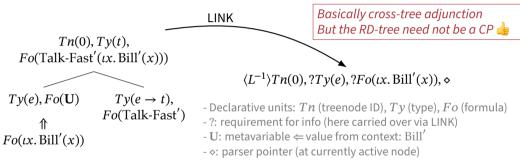

- BRD: two linked trees
- ARD: via an implicit question

Still only designed for familiar European patterns and inapplicable to MMRD.

Dynamic Syntax: BRD

(19) He_i talks too fast, [the new secretary]_i. (Cann et al. 2005)

Left tree: main clause (address 0, type *t*)

Right tree: RD-ed unit (address 'reversely linked to Tn(0)', requiring $Bill'_{(e)}$)

The ?-requirements can only be met by a term that refers to Bill.

Dynamic Syntax: ARD

Chatzikyriakidis (2016): clarification answers to implicit questions

```
(20) Ton<sub>i</sub> htipise o Giorgos, [ton Giani]<sub>i</sub>. [Greek] him.acc hit the George the.acc John.acc 'George hit him, John.' (ARD)
```

(Chatzikyriakidis uses "," to indicate a "period intonation" associated with afterthoughts.)

Interpretive effect: 'George hit him. You want to ask who George hit? George hit John.'

(i) Parse main clause. (ii) Parse afterthought. (iii) Make implicit question. (iv) Substitution.

Dynamic Syntax: ARD

(21) a. Implicit question 'Who did George hit?'

$$Ty(t),$$
 $Fo(\text{Hit}'(Wh_{\text{MALE}})(\text{George}'))$
 $Ty(e), \quad Ty(e \to t),$
 $Fo(\text{George}') \quad Fo(\text{Hit}'(Wh_{\text{MALE}}))$
 $Ty(e), \quad Ty(e \to (e \to t)),$
 $Fo(Wh_{\text{MALE}}) \quad Fo(\text{Hit}')$

- ✓ Clearly brings out the clarification function of ARD
- ☑ Truly lite (RD-ed units need not be elided from CPs)
- Can be extended to MRD (with multiple implicit Qs)

b. Substitution 'George hit John.'

$$Ty(t)$$
,
 $Fo(\text{Hit'}(\text{John'})(\text{George'}))$
 $Ty(e)$, $Ty(e \to t)$,
 $Fo(\text{George'})$ $Fo(\text{Hit'}(\text{John'}))$
 $Ty(e)$, $Ty(e \to (e \to t))$,
 $Fo(\text{John'})$ $Fo(\text{Hit'})$

(adapted from Chatzikyriakidis 2016)

Dynamic Syntax: MRD

Multiple ARD in Chatzikyriakidis's (2016) analysis:

```
(22) Ton<sub>i</sub> ida, [ton Giorgo]<sub>i</sub>, xtes. [Greek] him.Acc saw.1sG the.Acc George.Acc yesterday
'I saw him, George, yesterday.' (two metavariables: 'who', 'when')
```

Interpretive effect: 'I saw him. You want to ask who I saw? I saw George. You also want to ask when I saw George? I saw George yesterday.'

Limitations:

- Only works for constituent RD (since each DS tree must have a well-defined type)
- Relies on a relatively complete main clause (left-to-right parsing feeds on lexical content)

Thus, the DS analysis (despite its truly lite design) cannot be applied to Chinese MMRD either.

Literature review summary

Having reviewed how RD is analyzed in three theoretical frameworks, I conclude that MMRD is a challenge for all of them.

Table: Three previous approaches to RD

Approach	Framework	Advantage	Problem
Focus fronting	Minimalism	can derive inversion-like, nonconstituent RD	limited to SRD
Coord.+ellipsis	Minimalism	can derive MRD	limited to constituent RD, resource-demanding
Lite multi-tree syn.	DS (LFG)	can derive MRD, resource-sensitive	limited to constituent RD, needs complete main clause

Overview

- Introduction
- Literature review
 - Minimalism
 - LFG
 - Dynamic Syntax
- A new analysis
- 4 Summary

A new analysis

Proposal:

- Inheriting basic minimalist settings so that focus fronting can normally proceed
- Using multi-workspace derivation to implement lite multi-tree syntax in Minimalism

The reason why the original coordination-plus-ellipsis approach is resource-demanding is because it manipulates full-fledged CPs. There is no such requirement in multi-workspace derivation. The content of a side workspace may well be a vP, DP, etc.

Multi-workspace derivation has long been used in practice (e.g., Zwart 2011, Fowlie 2013).

(23) [The man] kicked the ball.

(Zwart 2011; pre-derived subject)

A new analysis: deriving MMRD

An MMRD sentence:

(24) Zaezae-zhou ae, dei, mae yunqi lai, haoshi-zhou. [Dongying Mandarin] save-DUR SFP must DISP luck LAI carefully-DUR (= 4b) 'Save up, must, (good) luck, carefully.' ≈ 'We must carefully save up our good luck.'

We can derive this sentence using **three workspaces** with just enough structure.

- (25) a. WS_1 (main + RD₁): $[F_{OCP}]_{VP}$ zaezae-zhou F_{OCD} pro $_{OCD}$ $[F_{OCC}]_{R}$ [Force F_{OCD} [GroundP F_{OCD} [GroundP F_{OCD} [GroundP F_{OCD} [GroundP F_{OCD}] (à la Sun 2022)
 - b. WS_2 (RD₂): [$_{VP}$ pro $_{S}$ [$_{V'}$ [$_{V}$ mae] [$_{ApplP}$ yunqi $_{o}$ [$_{Appl}$ [$_{Appl}$ lai] [$_{VP}$ zaezae-zhou t $_{o}$]]]]]
 - c. WS_3 (RD₃): [$_{VP}$ [$_{AdvP}$ haoshi-zhou] [$_{VP}$ pro $_{S}$ [$_{V'}$ v [$_{VP}$ zaezae-zhou pro $_{O}$]]]]

I analyze the disposal construction [$mae DP_i lai V t_i$] 'lit. hold DP come V it' as vP-ApplP-VP for now.

A new analysis: How (not) to coordinate workspaces?

Next, we coordinate the three workspaces, but

- not by discourse juxtaposition since the workspaces should be joined before the interfaces
- nor by a CoP (or :P) in phrasal syntax since it encodes more asymmetry than desirable
 - we do not want [WS₁ : [WS₂ : [WS₃ : ...]]] (pace Sun 2022)
 - because in MMRD only the main clause is fixed in position, while the RD-ed units can be freely reordered (i.e., no evidence for structural asymmetry)
 - so we want something like [WS₁ > {WS₂, WS₃, ... }] instead (where ">" means 'structurally above / more prominent than")

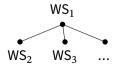

A new analysis: coordination via adjunction

$$[WS_1 > \{WS_2, WS_3, ...\}]$$

Set Merge cannot yield this structure (binary-branching!) but **Pair Merge** can (cf. Song 2024).

- Let WS_1 pair-merge with $WS_{i\geq 2}$ separately, each on a different plane. (see Chomsky 2004 et seq. and especially Chomsky 2019)
- $\bullet \ \ \mathsf{Get} \ \{ \langle \mathsf{WS}_1, \mathsf{WS}_2 \rangle, \langle \mathsf{WS}_1, \mathsf{WS}_3 \rangle, \langle \mathsf{WS}_1, \dots \rangle \}. \quad \boxed{1}$
- Order-theoretically, this is equivalent to $\langle WS_1, \{WS_2, WS_3, \dots \} \rangle$.
- Both 1 and 2 describe the same partial order, as in the following Hasse diagram:

A new analysis: loose semantic conjunction

Corresponding to this "loose coordination" in syntax, we can let the workspaces' contents be only **loosely conjoined** in semantics too:

- not by the boolean \land since not all workspaces have type-t values in our lite setting
- a generic coproduct (aka disjoined union) operation ⊕ is more suitable
 [WS₁] ⊕ [WS₂] ⊕ [WS₃] ⊕ [...]
- (26) Zaezae-zhou ae, dei, mae yunqi lai, haoshi-zhou. [Dongying Mandarin] save-DUR SFP must DISP luck LAI carefully-DUR (= 4b) 'Save up, must, (good) luck, carefully.' ≈ 'We must carefully save up our good luck.'

```
Interpretive effect (more pedantically): [WS_1] Save up (sth.), we must; [WS_2] saving luck; [WS_3] carefully saving (sth.)].
```

Bonus: protocolizing cross-workspace communication

We can take a step further and give the cross-workspace information integration a formal protocol—using a process calculus such as the **session calculus** (Yoshida & Gheri 2020).

In session-based modeling of concurrency and distributed systems, a communication **session** involves **participants** p, q, ... and their **processes** P, Q, ...

(27) $p \triangleleft P = !c\langle m \rangle.?d(x).0$ (The process P of participant p: send a message m via channel c, receive any message via channel d and assign it to variable x, and terminate.)

(See paper version for more detail.)

Bonus: protocolizing cross-workspace communication

We can view the cross-workspace information integration in an MMRD sentence as a session:

- Each workspace is a participant.
- Each Pair Merge step establishes a communication channel.
- The integrated information is ultimately fed to the C-I system (also viewed as a participant).

Our running example: $[WS_1]$ Save up, must], $[WS_2]$ (good) luck], $[WS_3]$ carefully].

- (28) a. $WS_2 \triangleleft P_{WS_2} = !a\langle \llbracket WS_2 \rrbracket \rangle$.0 (WS₂ sends its content as a message via channel a and terminates.)
 - b. $WS_3 \triangleleft P_{WS_3} = !b([WS_3]).0$ (WS₃ sends its content as a message via channel b and terminates.)
 - c. $WS_1 \triangleleft P_{WS_1} = ?a(x).?b(y).!s(\llbracket WS_1 \rrbracket \oplus x \oplus y \rangle.0$ (WS₁ receives two messages via channels a and b and assigns them to x and y, loosely conjoins the received messages with its own content, sends the coproduct via channel s, and terminates.)
 - **d.** CI $\triangleleft P_{CI} = ?s(z).0$ (CI receives a message via channel s, assigns it to z, and terminates.)

Overview

- Introduction
- Literature review
 - Minimalism
 - LFG
 - Dynamic Syntax
- A new analysis
- Summary

Summary

My analysis of Chinese MMRD is as follows:

(29) Zaezae-zhou **ae**, dei, mae yunqi lai, haoshi-zhou. save-DUR SFP must DISP luck LAI carefully-DUR '[ws, Save up, must], [ws, (good) luck], [ws, carefully].'

[Dongying Mandarin] (= 4b)

Syntax: Derived in three workspaces with just enough structure, loosely joined by Pair Merge

PF: Main clause fixed in position, RD-ed units flexible in ordering

LF: Three parallel (i.e., concurrent) thoughts, loosely joined by coproduct \oplus

Session: A protocolization of cross-workspace information integration

Thank you!

Acknowledgments

I thank Felix Bildhauer, Patrick Brandt, Francisco Ferreira, Timothy Osborne, Matthew Reeve, and Chen Xie for their direct or indirect help with my research for this study. Also thanks to the workshop organizer Jakob Maché and the anonymous reviewers for their constructive feedback on my abstract.
